

Empathy Map Matrix

PROJECT: INDIA'S AGRICULTURE CROP PRODUCTION ANALYSIS

SAYS	THINKS	DOES	FEELS	PAINS	GAINS
USER PERSONA: FARMERS					
• "Monsoons are too unpredictable to plan ahead." • "Market prices drop right when I harvest."	• Will my input investment yield a profit? • Can I trust mobile weather alerts?	• Borrows high-interest seed capital. • Copies crops grown by neighboring farms.	• Anxious about unexpected climate shifts. • Exploited by complex middleman networks.	• Severe crop loss due to droughts/pests. • No direct access to direct pricing metrics.	• Stable, predictable seasonal income. • Granular, localized harvest planning.
USER PERSONA: AGRICULTURAL OFFICERS					
• "I can't visit every single block manually." • "Farmers need advice before the pest spreads."	• How can I issue faster field warnings? • Are these paper reports accurate enough?	• Conducts physical spot-checks after damage. • Distributes generic state-level advisories.	• Overwhelmed by massive jurisdiction sizes. • Helpless due to lagging response tools.	• Slow, reactive disaster assessment. • Lack of direct field communication channels.	• Real-time regional crop metrics. • Targeted, highly efficient delivery.
USER PERSONA: GOVERNMENT AGENCIES					
• "We need accurate data for food security." • "Allocate relief funds to worst-hit areas."	• Are national food reserve metrics stable? • How do we trace misallocated subsidies?	• Aggregates lagged regional Excel files. • Formulates annual macro agricultural policies.	• Stressed by tracking food supply chains. • Frustrated by slow inter-agency sync.	• Decisions based on outdated census data. • Severe inflation tracking inaccuracies.	• A unified, auditable single-source database. • Proactive disaster mitigation workflows.
USER PERSONA: RESEARCHERS					
• "Clean, historical raw data is hard to find." • "Models fail without district granularity."	• Can we model climate-resilient crop mixes? • Why is useful spatial data kept behind silos?	• Manually cleans mismatched legacy data. • Builds local yield prediction prototypes.	• Thwarted by static government PDF logs. • Eager to deploy active predictive models.	• Hours wasted on basic dataset restructuring. • Lack of automated API validation tools.	• Open, machine-readable datasets. • Faster validation of predictive models.
USER PERSONA: AGRIBUSINESS COMPANIES					
• "Supply shortages disrupt processing units." • "We need clear output forecasts for buyers."	• Where are the optimal sourcing hubs? • Can contract farming minimize crop risk?	• Invests heavily in private corporate logistics. • Procures raw inputs through intermediaries.	• Vulnerable to unpredictable supply gaps. • Motivated to scale tech-driven farms.	• Financial losses from sudden crop failures. • High procurement costs via middlemen.	• De-risked, predictable raw material flows. • Data-backed geographic expansion insights.
